Title: Three-Element DC-Driven Series LRC Circuit

Author: K. Franklin and P. Signell and J. Kovacs, Michigan State University

Version: 2/1/2000 Evaluation: Stage B0

Length: 1 hr; 12 pages

Input Skills:

Output Skills (Knowledge):

K1. Starting from the charge-current and voltage-current relations for the three types of passive circuit element:

a. Derive the relation between the time rate of change of charge and the circuit parameters.

b. Given a solution for the relation, evaluate as many constants as possible without using any information about the circuit’s initial state.

c. Explain why two solution forms are necessary for the relation.

Post-Options:

The goal of our project is to assist a network of educators and scientists in transferring physics from one person to another. We support manuscript processing and distribution, along with communication and information systems. We also work with employers to identify basic scientific skills as well as physics topics that are needed in science and technology. A number of our publications are aimed at assisting users in acquiring such skills.

Our publications are designed: (i) to be updated quickly in response to field tests and new scientific developments; (ii) to be used in both classroom and professional settings; (iii) to show the prerequisite dependencies existing among the various chunks of physics knowledge and skill, as a guide both to mental organization and to use of the materials; and (iv) to be adapted quickly to specific user needs ranging from single-skill instruction to complete custom textbooks.

New authors, reviewers and field testers are welcome.

THREE-ELEMENT DC-DRIVEN SERIES LRC CIRCUIT
by
K. Franklin, P. Signell, and J. Kovacs
Michigan State University

1. Introduction and Description

In this module we analyze the special case of the D.C.-driven series LRC circuit. By "series LRC" we mean there is an inductor, a resistor, and a capacitor connected in series. By "D.C.-driven" we mean that a direct-current voltage is applied for some period of time and there is no other source of EMF (see Fig. 1.). We examine the mathematics used to find a complete solution for the time dependence of the circulating charge.

2. Study Comments

The general method of attack on the D.C.-driven three-element circuit is the same as that used in the two-element case.1 The reason the 3-element circuit is treated separately is that there are two solutions. To see why, we work through the circuit shown in Fig. 1.

Following the same procedure used for the 2-element circuit, we easily arrive at the fundamental equation for this circuit:

\[ V_c = L \frac{dq(t)}{dt} + R \frac{d^2q(t)}{dt^2} + \frac{1}{C} q(t) \]

A solution of Eq. (1) is:

\[ q(t) = q_0 + q_1 e^{-at} \sin(bt + d), \] (2)

\[ V_c = \Lambda q_1 e^{-at} \sin(bt + d) + (Rb - 2Lab)q_1 e^{-at} \cos(bt + d) + \frac{q_0}{C}, \] (3)

where \( q_0, q_1, a, b \) and \( d \) are constants.

To prove that this is indeed a solution, we insert it and its first and second derivatives into Eq. (1). Collecting terms, we get:

\[ V_c = \Lambda q_1 e^{-at} \sin(bt + d) + (Rb - 2Lab)q_1 e^{-at} \cos(bt + d) + \frac{q_0}{C}, \]

where we have defined for convenience:

\[ \Lambda \equiv La^2 - Lb^2 - Ra + \frac{1}{C}. \]

Since Eq. (3) holds for all times \( t \), we can evaluate the constants at any time we wish. To make our job easy we choose \( t \) such that \( e^{-at} = 0 \) \((t \rightarrow \infty)\). We get:

\[ V_c = \frac{q_0}{C}, \]

so

\[ q_0 = CV_c. \] (4)

Putting this back into Eq. (3) and rearranging gives:

\[ V_c - \Lambda q_1 e^{-at} \sin(bt + d) = V_c + (Rb - 2Lab)q_1 e^{-at} \cos(bt + d). \] (5)

Cancelling terms,

\[ -\Lambda \sin(bt + d) = (Rb - 2Lab) \cos(bt + d). \] (6)

We now choose to evaluate Eq. (6) at \( t = -d/b \) so \( \sin(bt + d) = 0 \) and \( \cos(bt + d) = 1 \), resulting in:

\[ Rb - 2Lab = 0, \]

so:

\[ a = \frac{R}{2L}. \] (7)

After substituting this into (6), we pick \( t \) so that \( \sin(bt + d) = 1 \) and \( \cos(bt + d) = 0 \), giving:

\[ Lb^2 - \frac{R^2}{4L} + \frac{R^2}{2L} - \frac{1}{C} = 0. \]

Solving for \( b \) gives:

\[ b = \sqrt{\frac{1}{LC} - \frac{R^2}{4L^2}}. \] (8)
Here is what we have found: Eq. (2) is a solution to Eq. (1) providing \( q_0, a, \) and \( b \) are restricted to certain combinations of the circuit parameters. However, Eq. (2) is a solution to Eq. (1) no matter what the values of \( q_1 \) and \( d \), so these latter are the two adjustable constants required in a solution of a second order differential equation. They must be set from the initial conditions for a particular problem you are wanting to solve.

The solution we have developed has a problem if \( R^2/4L^2 > 1/LC \), for then the argument of the square root in Eq. (8) is negative! Then we must add a restriction to the solution we have found:

\[
q(t) = CV_e + q_1 e^{-(R/2L)t} \sinh\left(\sqrt{\frac{1}{LC} - \frac{R^2}{4L^2} t + d}\right); \quad R \leq 2\sqrt{L/C}. \quad (9)
\]

Now what about cases that violate the restriction? For such cases we replace the circular functions, sine and cosine, with their hyperbolic counterparts:

\[
\sinh(t) \equiv \frac{e^t - e^{-t}}{2}, \quad \cosh(t) \equiv \frac{e^t + e^{-t}}{2}.
\]

Note that the derivative of (cosh) is (+ sinh), as opposed to the derivative of (cos) being (− sin) for the circular functions. We write this solution as:

\[
q(t) = q_0 + q_1 e^{-at} \sinh(b't + d'),
\]

where \( q_0, q_1, a, b' \) and \( d' \) are constants. Substitution into Eq. (1) produces:

\[
V_e = \Lambda' q_1 e^{-at} \sinh(b't + d') + (Rb' - 2Lab') q_1 e^{-at} \cosh(b't + d') + \frac{q_0}{C},
\]

where:

\[
\Lambda' \equiv La^2 + Lb'^2 - Ra + \frac{1}{C}.
\]

Substituting into Eq. (10) and cancelling yields:

\[
\left(-Lb'^2 - \frac{R^2}{4L} + \frac{R^2}{2L} - \frac{1}{C}\right) \sinh(b't + d') = 0.
\]

Since this holds for any \( t \), and \( \sinh(b't + d') \) is not always zero, the coefficient of \( \sinh(b't + d') \) must be zero:

\[
-Lb'^2 - \frac{R^2}{4L} + \frac{R^2}{2L} - \frac{1}{C} = 0.
\]
MODEL EXAM

\[ q(t) = q_0 + q_1 e^{-at} \sin(bt + d) \]
\[ q(t) = q_0 + q_1 e^{-at} \sinh(b't + d') \]
